

UV DTF APPLICATION

PREPARATION

- Ensure you are applying to a clean dry surface, void of any oils or dust
- Clean the surface with a 95+% Alcohol product to ensure it's clean

APPLICATION

When preparing for transfer **always peel the backing sheet away from the image**, this is easiest with the image face down on a flat surface.

Hold the image face down, keeping downward pressure on it. Then **peel the backing away while also keeping downward pressure on the backing sheet**.

Place the decal in the position you want and rub it onto the surface. A vinyl applicator will help aid the adhesion of the print to your product.

Once you have made sure the decal is fully adhered, **peel back the carrier while being careful in any fine detail areas of the image**.

Do not pull the lamination film upward, use the same technique as above where you peel away while keeping downward pressure on the print.
